## IR switch

## Description

The passive infrared switch can be used to automatically switch on devices when people pass by (for example, the light switches on without operating the switch or button). Suitable for all types of loads, including LED lamps.
In order to optimise performance, it is possible to adjust the device activation threshold depending on the amount of natural light, and set a switch-off delay after the last movement detected. The operating range may be increased by installing several devices in different positions, with parallel outputs.
The volume coverage is ensured by 3 levels of $A, B$ and $C$ rays, tilted at $+2,-6$ and -30 degrees in relation to the installation axis, and extends for 4 metres.

## Technical data

## Power supply:

Switching-on time adjustment:
Twilight adjustment:
Working temperature:
$230 \mathrm{Vac} \pm 10 \% 50 \mathrm{~Hz}$
from 30 seconds - 10 minutes
from 5 lux to excluded
$5-40^{\circ} \mathrm{C}$

## Legend

1. Twilight adjustment
2. Switching off delay adjustment
3. Connection clamps

## Dimensional data

1 flush-mounted module

## Controllable loads

|  | Incandescence lamps Halogen lamps |  | Compact fluorescent lamps LED lamps |  | Linear fluorescent lamps |  | Electronic transformers |  | Reducer motors for rolling shutters |  |
